DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of Group I (claims 1-2 and new claims 11-28 in the reply filed on April 19, 2006 is acknowledged.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-2 and 11-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ushirogouchi et al (EP 1 357 159) in view of Mantell et al (EP 0 779 346).

Ushirogouchi et al teaches liquid inks for ink-jet applications. Said ink comprises a photo-acid generating agent that generates an acid upon exposure to irradiation, a coloring component, and at least one kind of polymerizable solvent that is polymerized in the presence of an acid. Said polymerizable solvent contains at least 50 parts by weight a compound having an alicyclic skeleton and/or an aliphatic skeleton having a viscosity of 50 mPa*s or less and a boiling point of 150 OC or more under room temperature and atmospheric pressure. The ink composition should have a fluidity of at least 30 cp. For this to be satisfied it is desirable to mix different kinds of polymerizable solvent monomers, such as compounds having the formulas (1) or (2), see page 19, which have a viscosity of about 1 to 30 cp, and compounds having the general formula (3), see page 20, which has a viscosity of between 20 to about 500 cp. The compounds disclosed by Ushirogouchi et al of general formulas (1), (2) and (3) appear to anticipate claims 11-14, 18-19, and 21-22, wherein formulas (1) - (3) read on the latter claims. The ratio of high viscosity to low viscosity polymerizable solvent is disclosed as being from 1:1 or 1:10—see page 20. This appears to read on claim 20. Said ink can further comprise oxetane compounds and vinyl ether compounds for improving transfer capabilities, adjusting viscosity, and improvement

Page 2

Application/Control Number: 10/806,818

Art Unit: 1711

in the photocurable rate. Per sections [0048] through [0063], Ushirogouchi et al teaches adding pigments and powdery materials to said polymerizable solvent. The particles size of said pigments and powder is disclosed as being from 0.1 to 0.3 microns. Additionally, basic compounds such as those found in section [0108] can be added to said ink composition to suppress corrosion in the ink jet head of a recording apparatus—see page 24. When printing on surfaces that exhibit strong basic character it is possible to suppress the effects of the generated acid on the substrate by adding a radically polymerizable compound, such as an (meth) acrylate, vinyl or styrene based compounds. Said acid generating compounds are found on pages 5-16, wherein at least some of those in claim 27 can be found. The method claim 28 can be found in the reference in said examples and throughout the disclosure.

Page 3

Ushirogouchi et al does not expressly teach preparing and preserving the photo-acid generating compound as a separate solution. However, this is a known process step in the art of ink jet compositions and printing methods. Mantell et al teaches a similar ink composition comprising an liquid epoxy or vinyl ether component, a colorant, and a photo-acid generating onium salt, wherein said composition can further comprise pH adjusting agents, such as basic compounds, vinyl compounds. Mantell et al teaches that said photo-acid generating compound can be kept separate from the curable ink composition until the ink is ejected, which can be jetted onto the substrate prior to the ink composition. This ensure that the ink will not polymerize in the print-head regardless of the amount of stray light that reach the front face of the nozzles, thus maintaining the stability of the ink composition until use.

Ushirogouchi et al and Mantell et al are analogous art because they are from the same field of endeavor that is the art of cationically cured inkjet ink compositions. Therefore it would have been obvious for an artisan of ordinary skill in the art to prepare and separate the photo-acid generating compound from the polymerizable ink composition and its components as suggested by Mantell et al in ink compositions as taught by Ushirogouchi et al. The motivation would have been a reasonable expectation of obtaining a stable ink composition as taught by Mantell et al in the absence of evidence to the contrary.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

Art Unit: 1711

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 5. Claims 1-2, 11-14, 17-18, and 23-28 are rejected under 35 U.S.C. 102(b) as being anticipated by Mantell et al (EP 0 779 346).

Mantell et al teaches a ink composition comprising an liquid epoxy or vinyl ether component, a colorant, and a photo-acid generating onium salt, wherein said composition can further comprise pH adjusting agents, such as basic compounds, vinyl compounds. Mantell et al teaches that said photo-acid generating compound can be kept separate from the curable ink composition until the ink is ejected, which can be jetted onto the substrate prior to the ink composition. This ensure that the ink will not polymerize in the print-head regardless of the amount of stray light that reach the front face of the nozzles, thus maintaining the stability of the ink composition until use. Per example 1, Mantell et al teaches his polymerizable compound to be a mono-vinyl ether compound, which has a boiling point of 208 0C and a molecular weight of 132.16 in combination with a pigment dispersion, which is prepared separately from the photo-acid generating composition (see example 6). Example 6 is deemed to read on claim 28. Said photo-acid generating agents can be found on page 4, which appear to anticipate at least some of those found in claim 27. Said pigments are disclosed as having average particle sizes in range from 0.005 to 0.3 microns—see page 4. The teachings of the reference are deemed to anticipate the instantly claimed invention of the above listed claims.

Conclusion

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sanza L. McClendon whose telephone number is (571) 272-1074. The examiner can normally be reached on Monday through Friday 7:30-4:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Seidleck can be reached on (571) 272-1078. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
